

Ricky van Broekhoven: Sonoscope, 2018

Interactive media installation

Music is made from hidden soundwaves. Sonoscope transforms these into an immersive spectacle.

It uses sound energy to generate patterns in a basin of water. With light and carefully positioned lenses it makes a captivating projection. The transparently designed machine works purely mechanical and shows the miraculous physics of sound. It's made from CNC - cut polished aluminium and custom made laboratory glass.

It makes listening to music become a spatially engaging performance.
